

# Observing System Monitoring Center

# Integrating data and information across observing system networks

# OSMC background

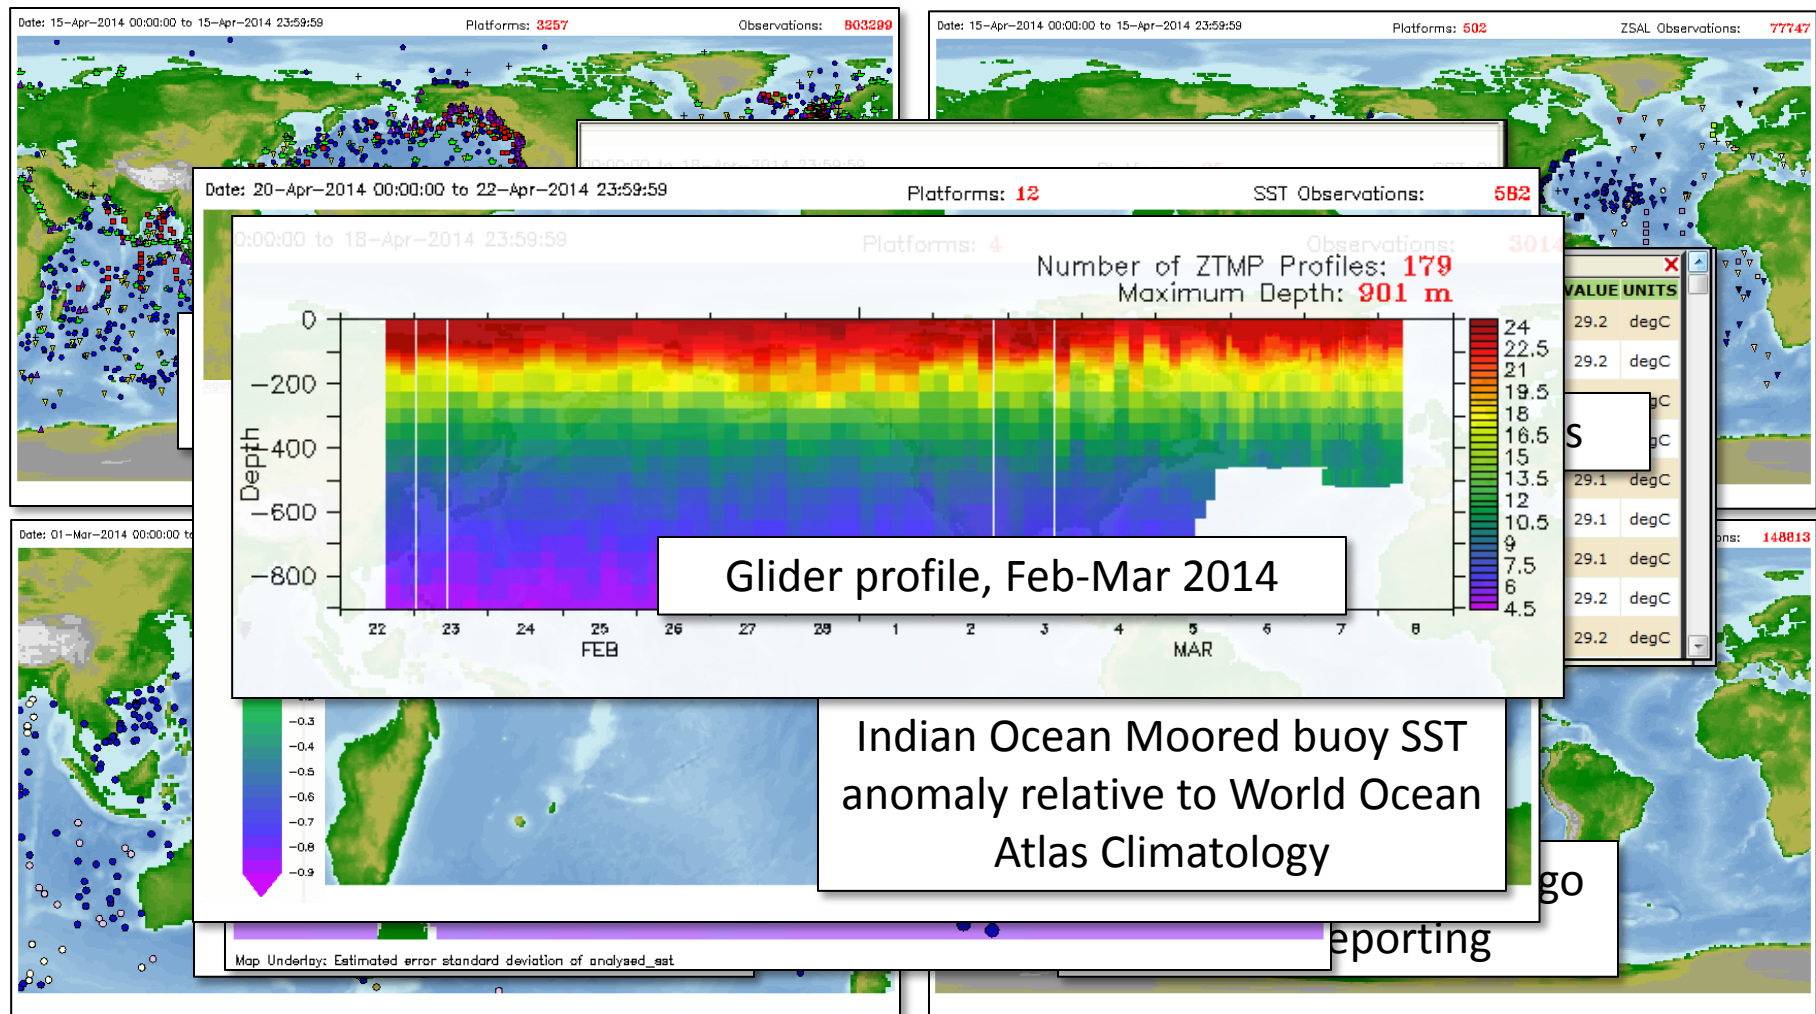

Database of data and metadata (*“realtime”*)

- GTS -- primary source
- Data begins in June, 2004
- ~2 billion observations

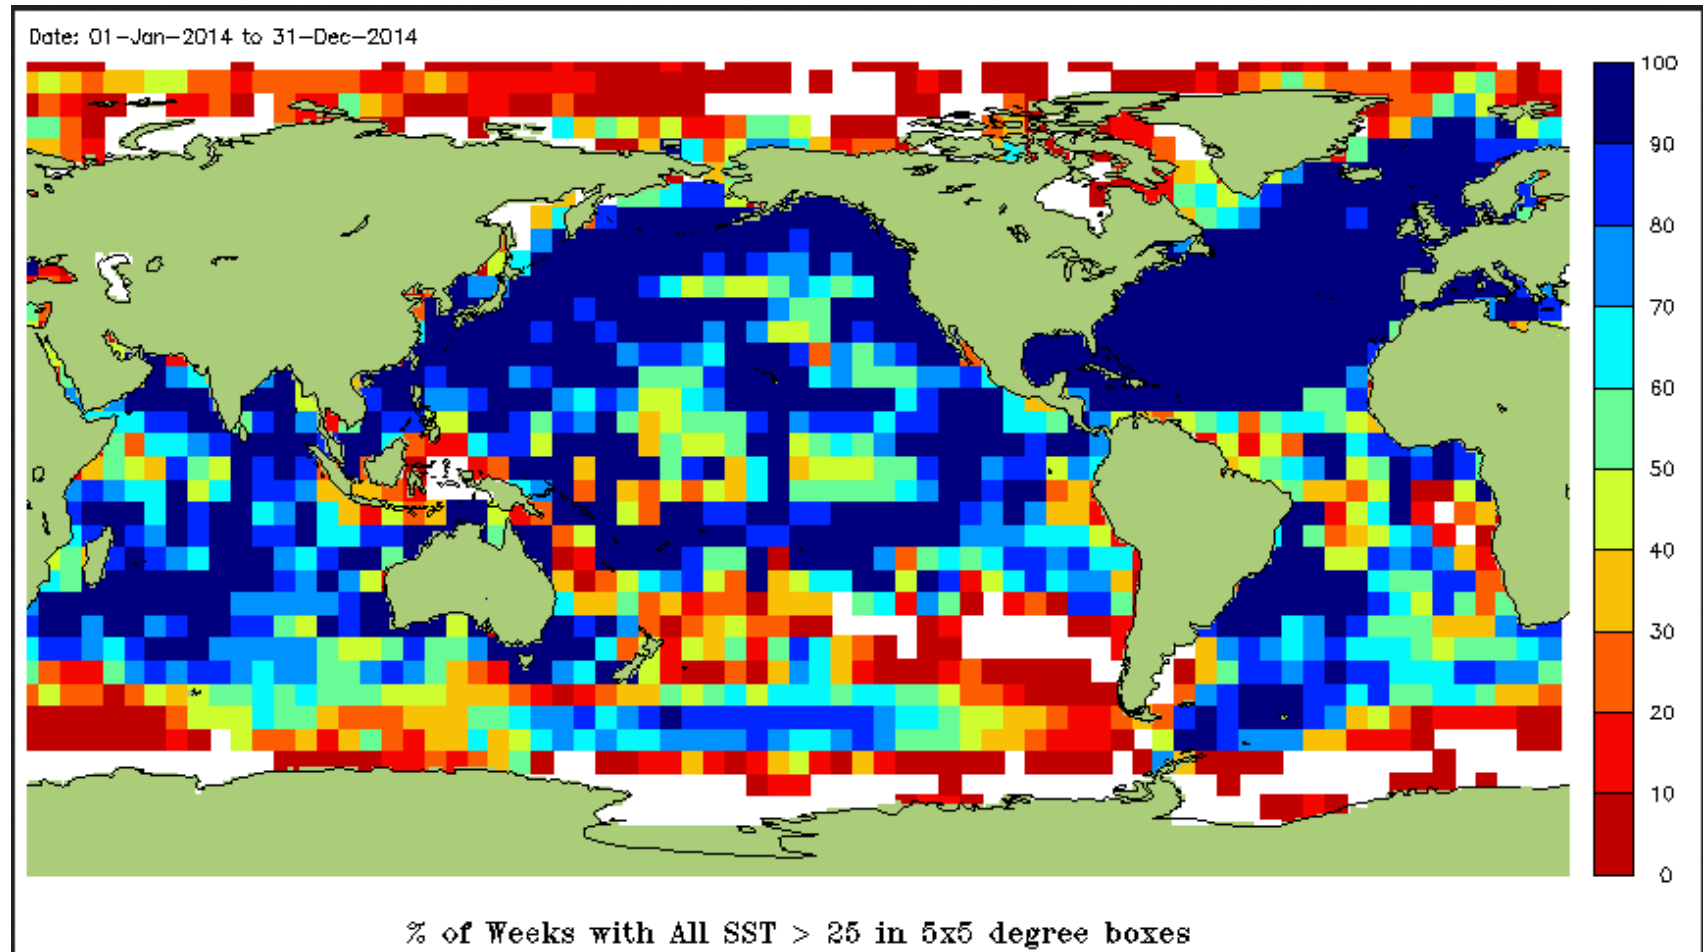

# Monitoring

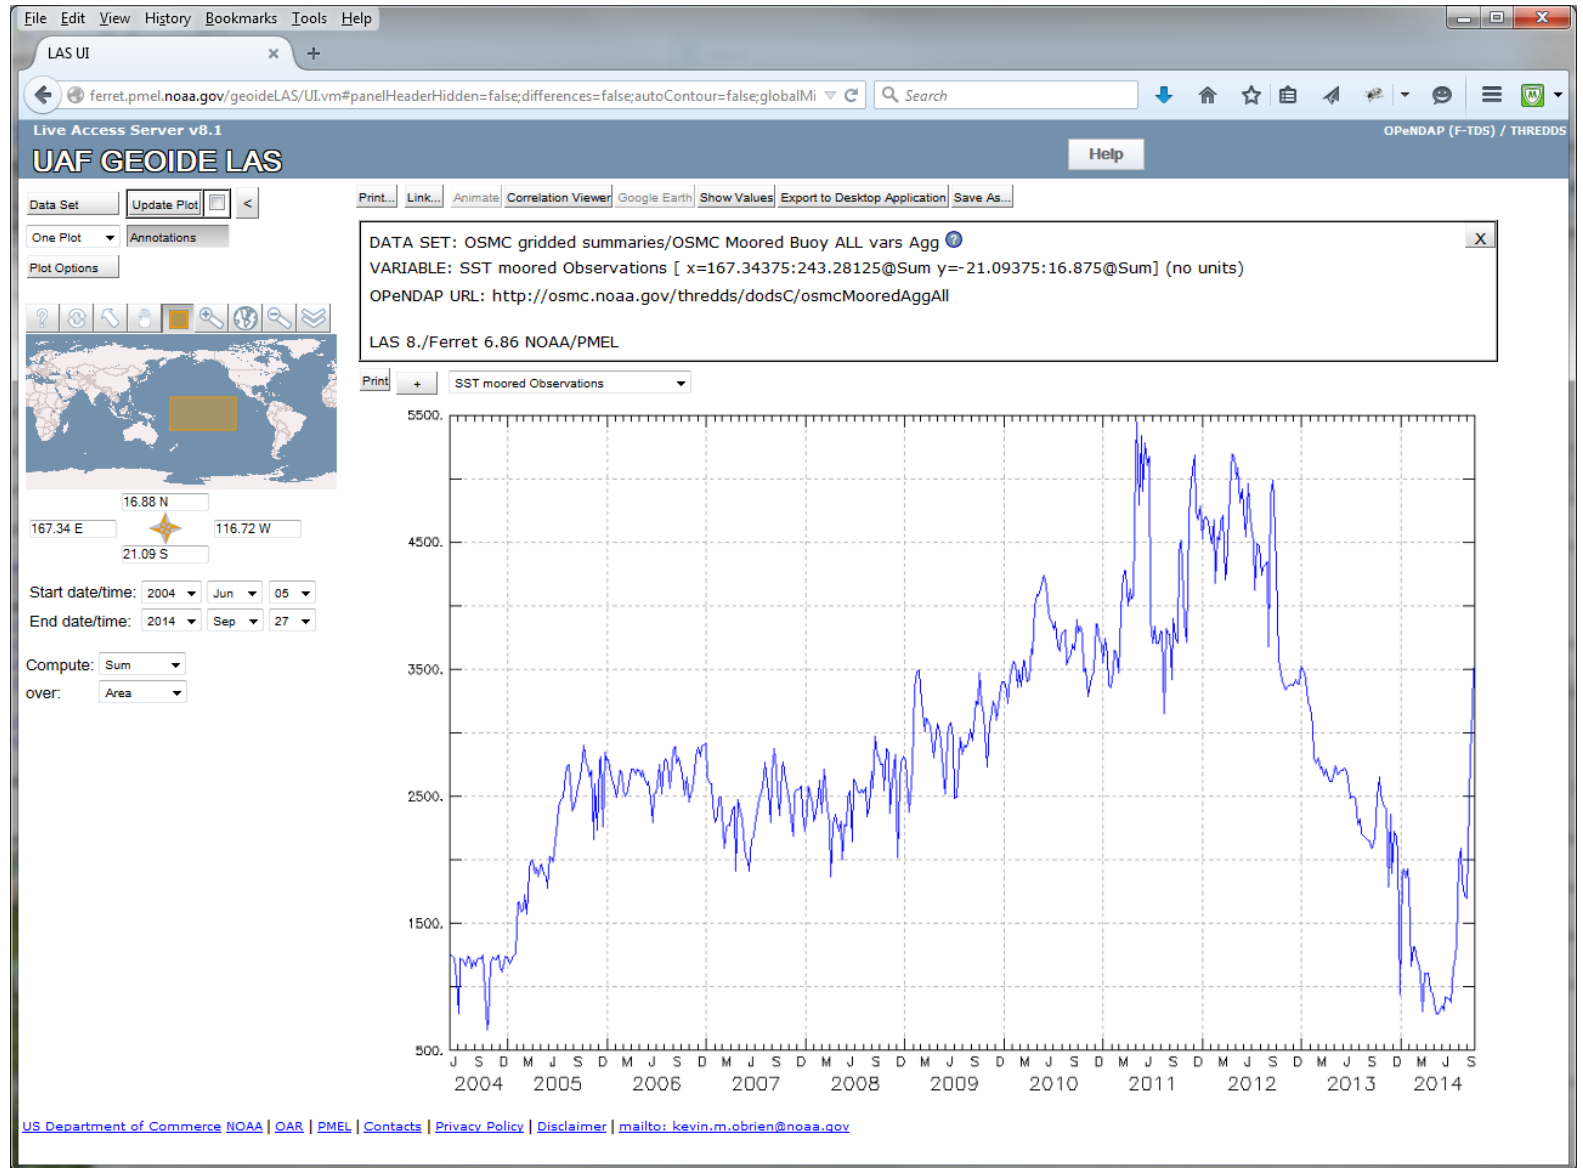

# OSMC tools

# Metric examples

## Summary counts available to other applications

# What about the actual data?

- QC'd data can take months to become available
  - Forecast models could utilize NRT data to improve their forecasts
- Can be difficult to obtain (GTS)
- Challenge: provide interoperable access to valuable NRT data
  - With limited funding
  - With limited burden placed upon providers

# What is "integrated data management?"

A Web page

Email requests

A site requiring registration

An ftp site

## Barriers to integration include:

Stovepipes

Download required

Differing formats

Limited or No machine-machine access

- Users prefer to use tools they are familiar with
- Users want to interact with collections of features
- Users would prefer to not have to fuss over formats
- Users need to find the data

Users: (too many to name)

# ERDDAP

- Out of NOAA Pacific Fisheries Environmental Lab
- Data server that provides services
- Acts as middleman to reduce complexity when accessing data in many common formats
- Has a Web page for humans, but utilizes RESTful Web services
  - Crucial for machine to machine access
- Multitude of clients can connect and access data through ERDDAP

GTS

Integration strategy provides multiple access and discovery services for near real time data

Real time

REST services  
via  
OSMC/ERDDAP

Live Access Server

Google Earth

iPython notebook

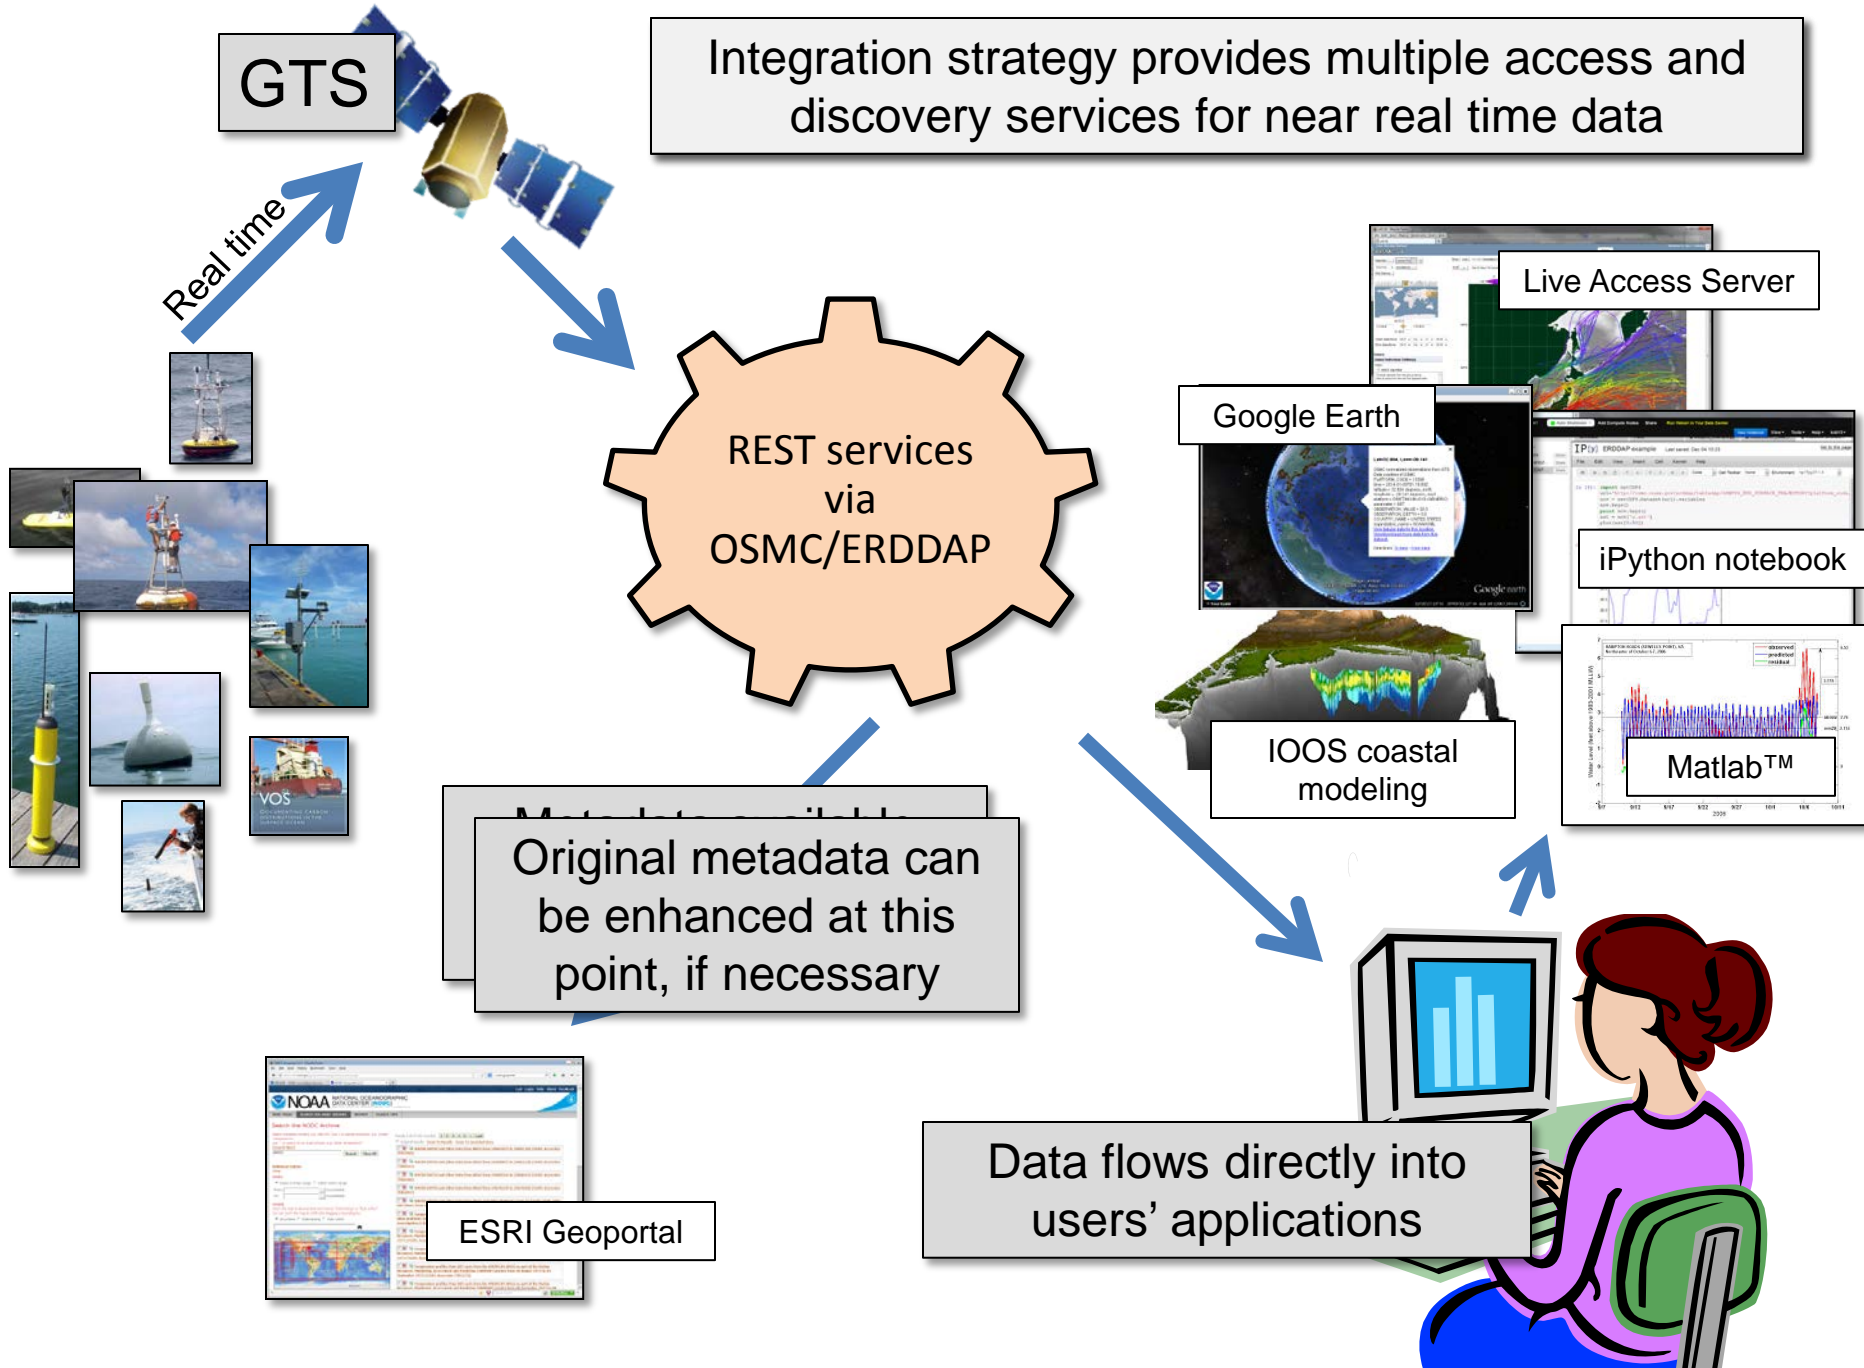

IOOS coastal  
modeling

Matlab™

Original metadata can  
be enhanced at this  
point, if necessary

Data flows directly into  
users' applications

Integration strategies that provides multiple access and discovery services for near real time data can be leveraged for delayed mode data as well

# Integration of delayed-mode data

- Also serve through ERDDAP
  - Provides standard queries to access all data
- Allow easy comparison between NRT and delayed mode data

# Integration of delayed-mode data

- Serve through ERDDAP
  - Provides standard queries to access all data
- Allow comparison between NRT and delayed mode data
- Allow integration of data
- Users can work with parameters, not platforms

GOAL: Investigate “Surface” Temp from the In Situ Ocean observations from 2012. Platforms include:

- Argo
- Drifter
- SOCAT underway
- Gosud underway
- Tropical Moored buoys

# Getting the data – current steps

## Argo

- Can select region at Coriolis
- Download notification via email
- ftp files
- Argo netCDF format

## Drifter

- ftp available from AOML
- Can select region, or just download full regions
- ASCII format, with metadata in separate file

## GOSUD

- Available via ftp
- Download all data, no subsetting
- netCDF format

## SOCAT data collection

- Available as zip file for whole collection or individual cruise files
- Can download Tropical Pacific
- ASCII data – excel file

## Tropical Moored Array data

- Available through PMEL
- Can use UI to select platforms
- Download netCDF data

# Getting the data - integrated

use [http://dunkel.pmel.noaa.gov/erddap/taledap/integrated\\_SST?time,longitude,latitude,temp](http://dunkel.pmel.noaa.gov/erddap/taledap/integrated_SST?time,longitude,latitude,temp)  
go polymark poly/lev=(-INF)(15,35,1)(INF) 'LONGITUDE' 'LATITUDE' 'TEMP'

# Getting the data - integrated

Regrid to 1x1 degree box

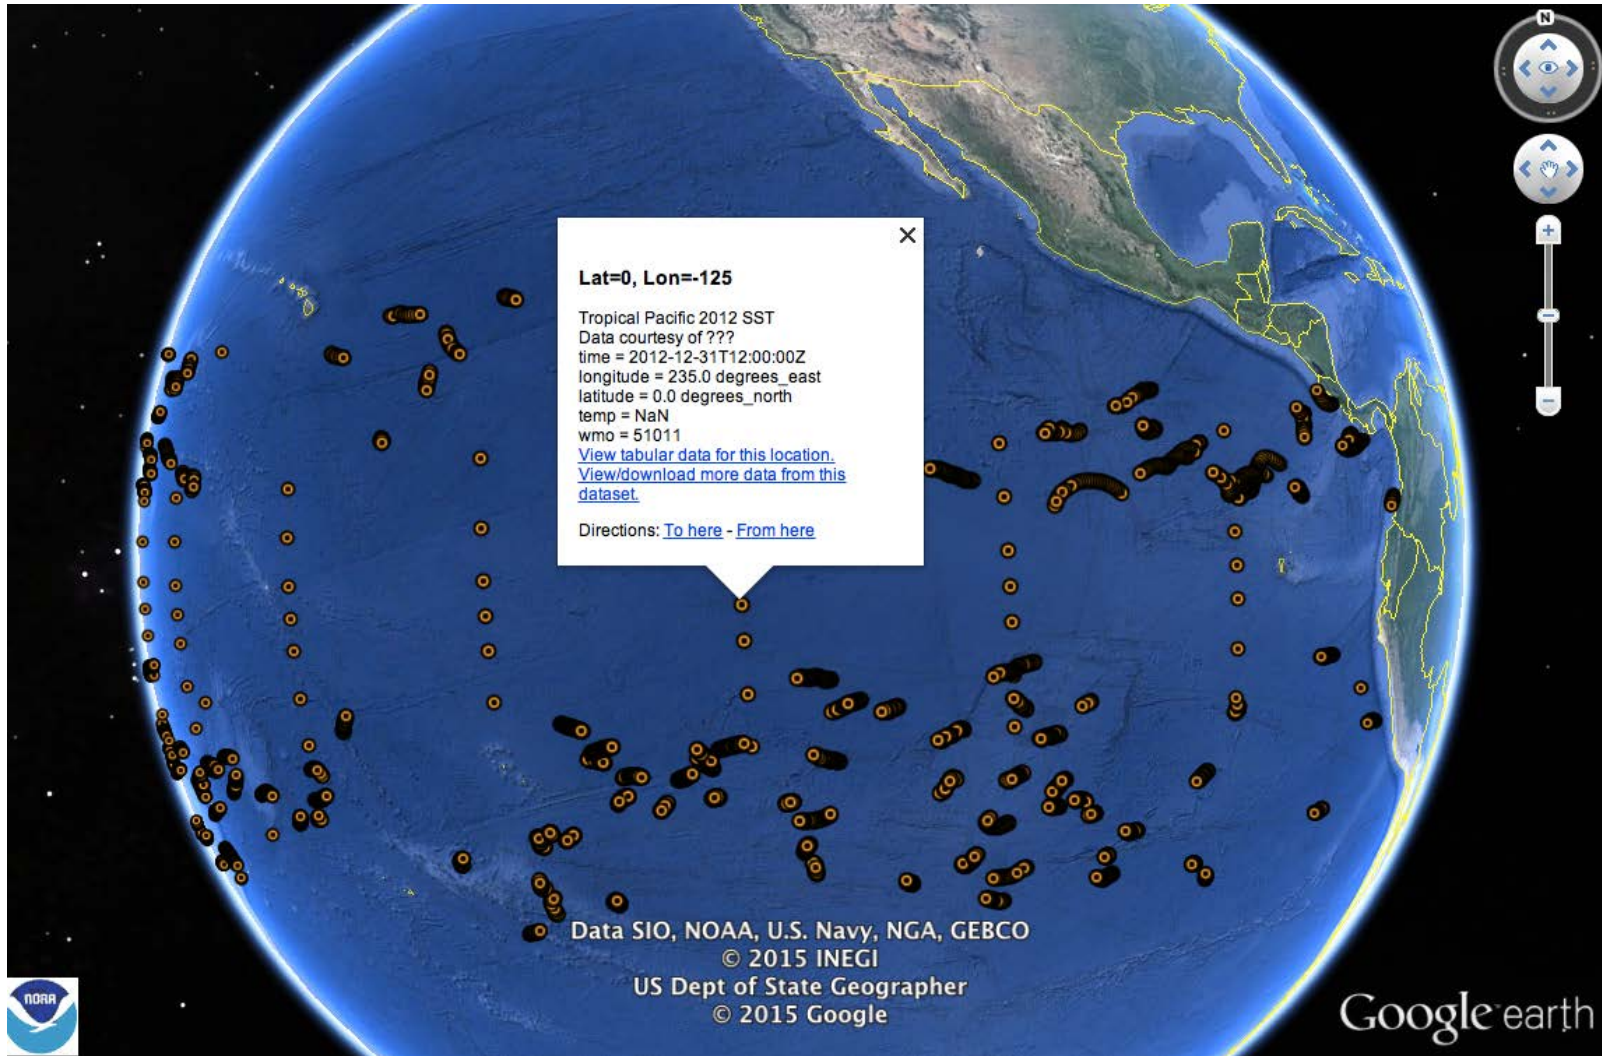

# Getting the data - integrated

Can now easily compare with climatological surface temp

# Getting the data - integrated

use [http://dunkel.pmel.noaa.gov/erddap/taledap/integrated\\_SST.kml?time,longitude,latitude,temp](http://dunkel.pmel.noaa.gov/erddap/taledap/integrated_SST.kml?time,longitude,latitude,temp)

# Getting the data - integrated

use [http://dunkel.pmel.noaa.gov/erddap/taledap/integrated\\_SST.csv?time,longitude,latitude,temp](http://dunkel.pmel.noaa.gov/erddap/taledap/integrated_SST.csv?time,longitude,latitude,temp)
